

How to configure Web Hosting plugin

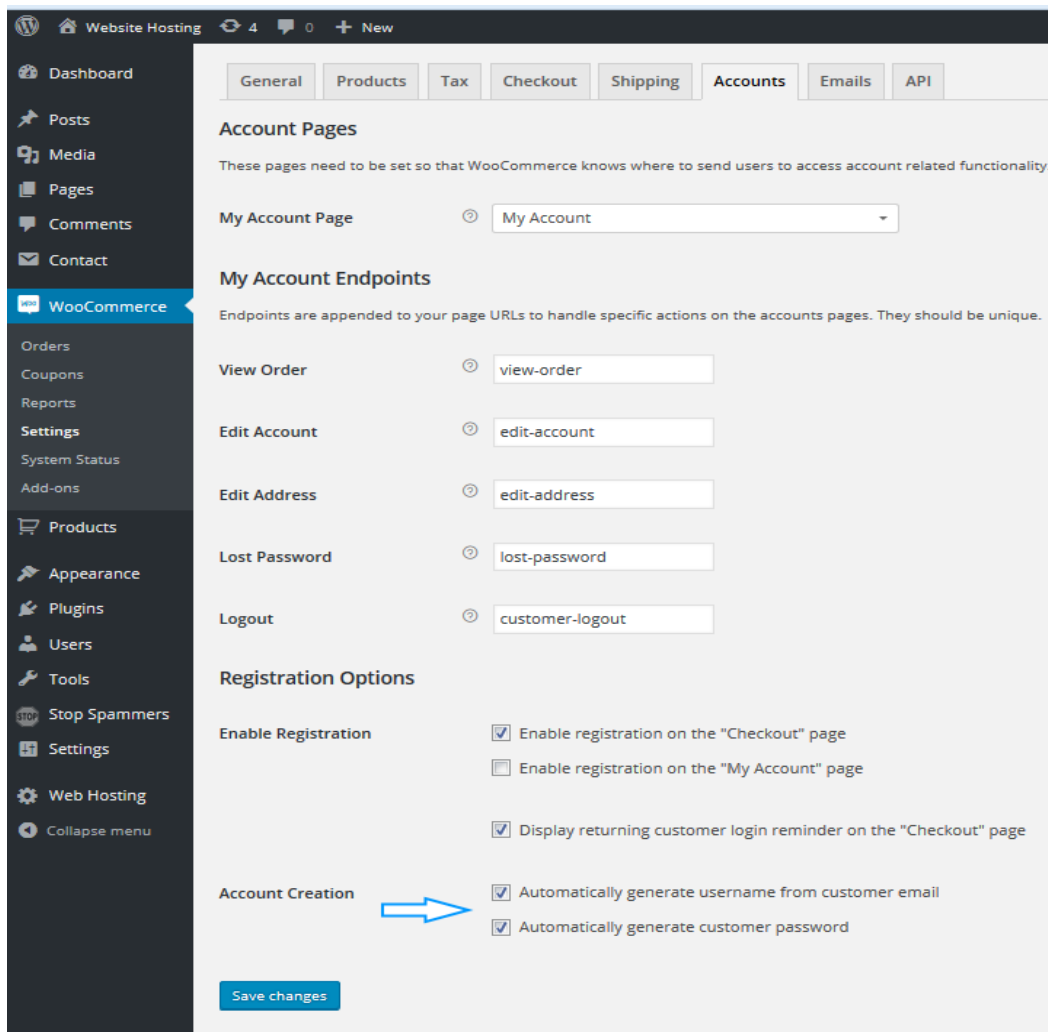

Install and Activate WooCommerce plugin

After carrying out WooCommerce initial setup

In left-hand admin menu go-to WooCommerce → Settings and click on Accounts tab

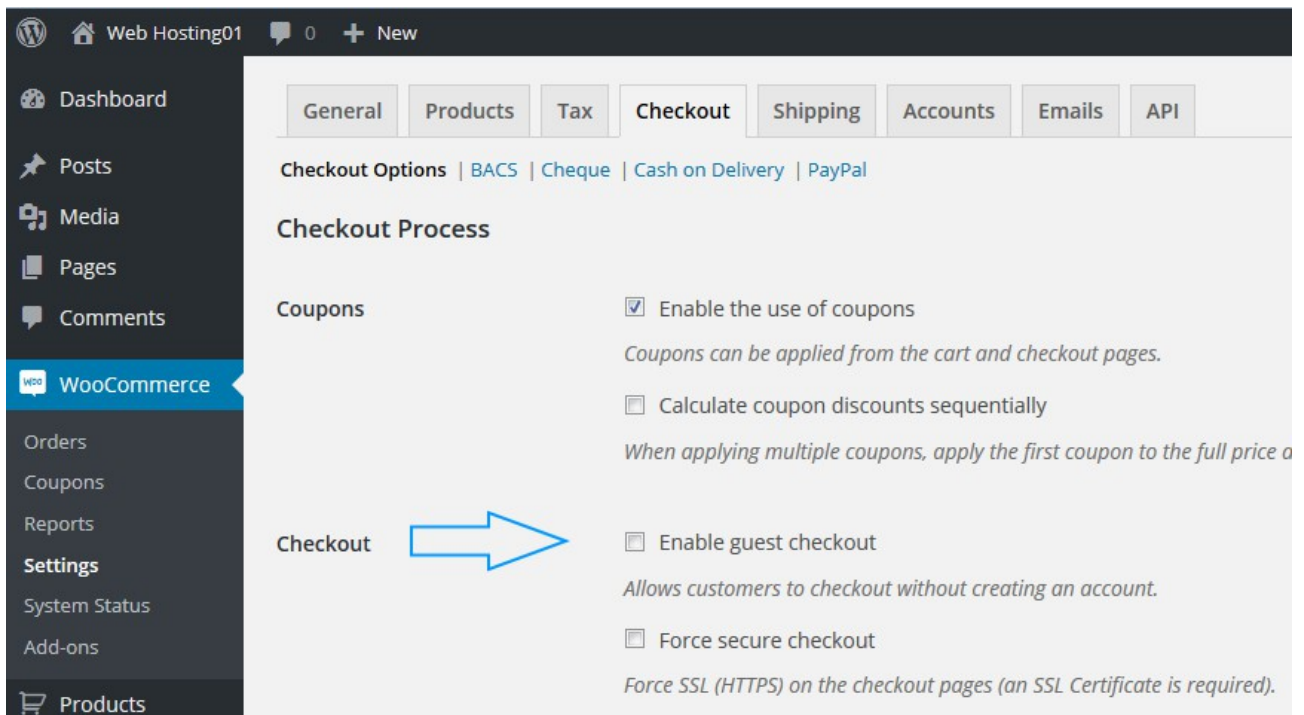

In Account Creation Section if not checked
check Automatically generate username from customer email
check Automatically generate customer password

save changes.

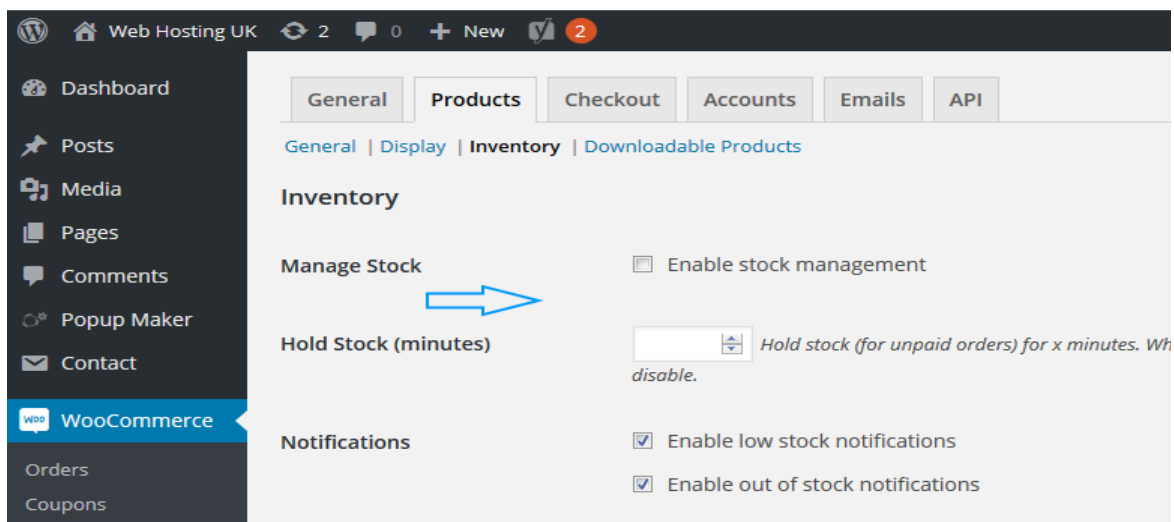

Click on Checkout tab
In Checkout Section
Uncheck Enable guest checkout

save changes.

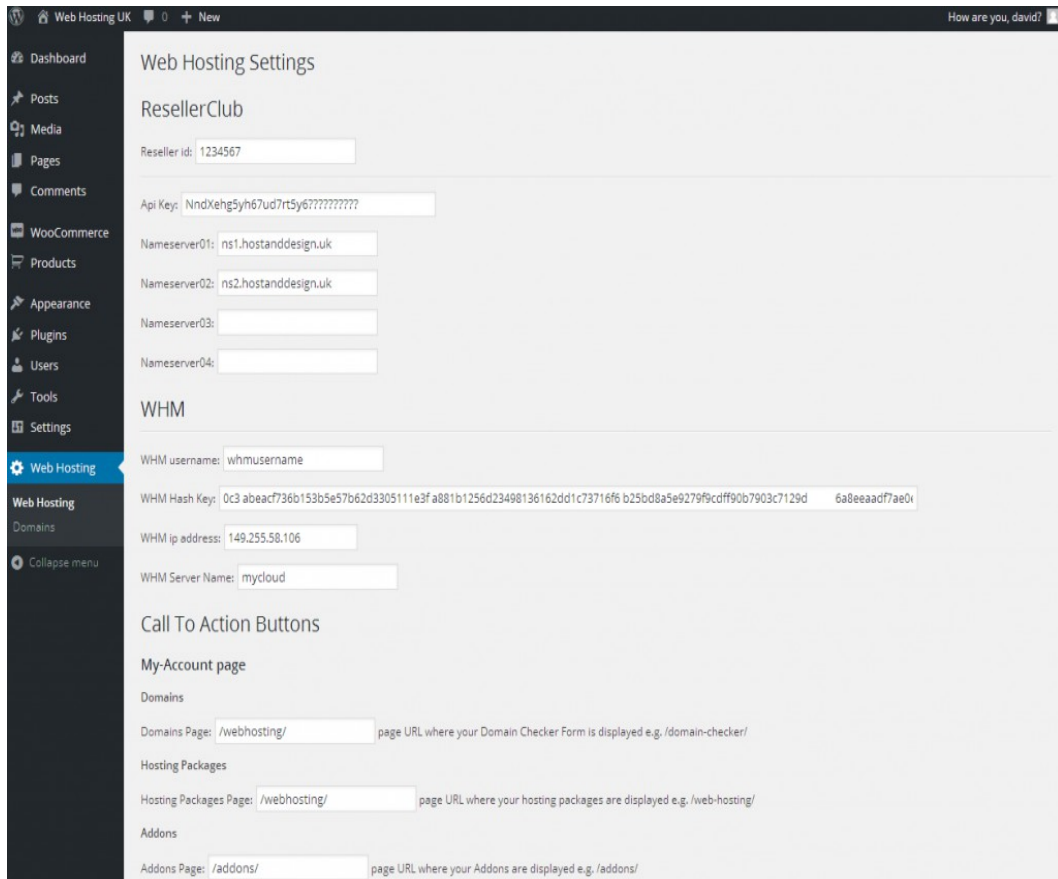

Click on Products tab click on Inventory either uncheck Enable stock management or leave Hold Stock (minutes) blank

Web Hosting Plugin

Install Web Hosting plugin.

In left-hand admin menu go-to Web Hosting → Web Hosting

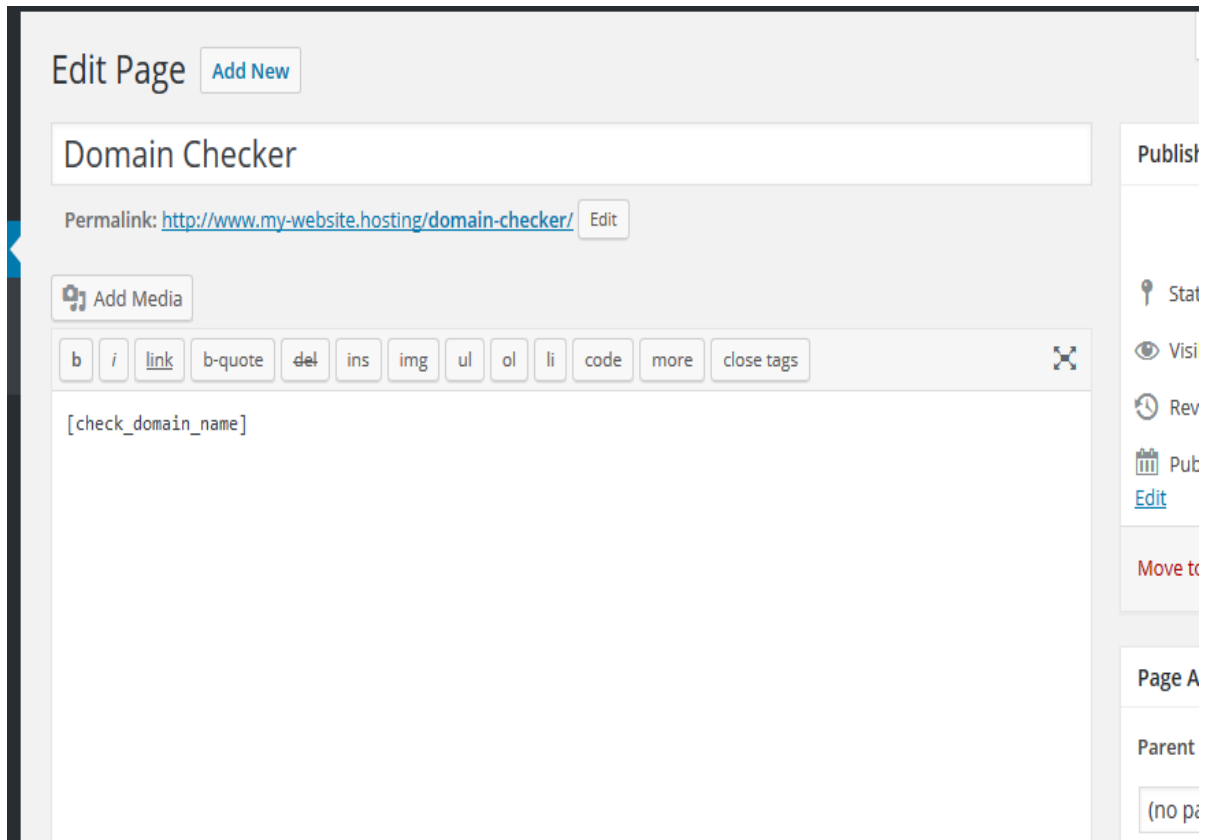

Fill in your Resellerclub account details.

Fill in your WMH details.

Call To Action Buttons

Domains Page: page URL where your Domain Checker shortcode [check_domain_name] is displayed e.g. /domain-checker/

when a visitor uses the domain name search form it will redirect to the page you configure here, on that page you will need to use shortcode [check_domain_name] to display the results.

Hosting Packages Page: page URL where your hosting packages are displayed e.g. /web-hosting/

Add-ons: page URL where your Add-ons are displayed e.g. /addons/

Woocommerce Continue Shopping Button In Cart: page URL where your products are displayed e.g. /shop/

Orders

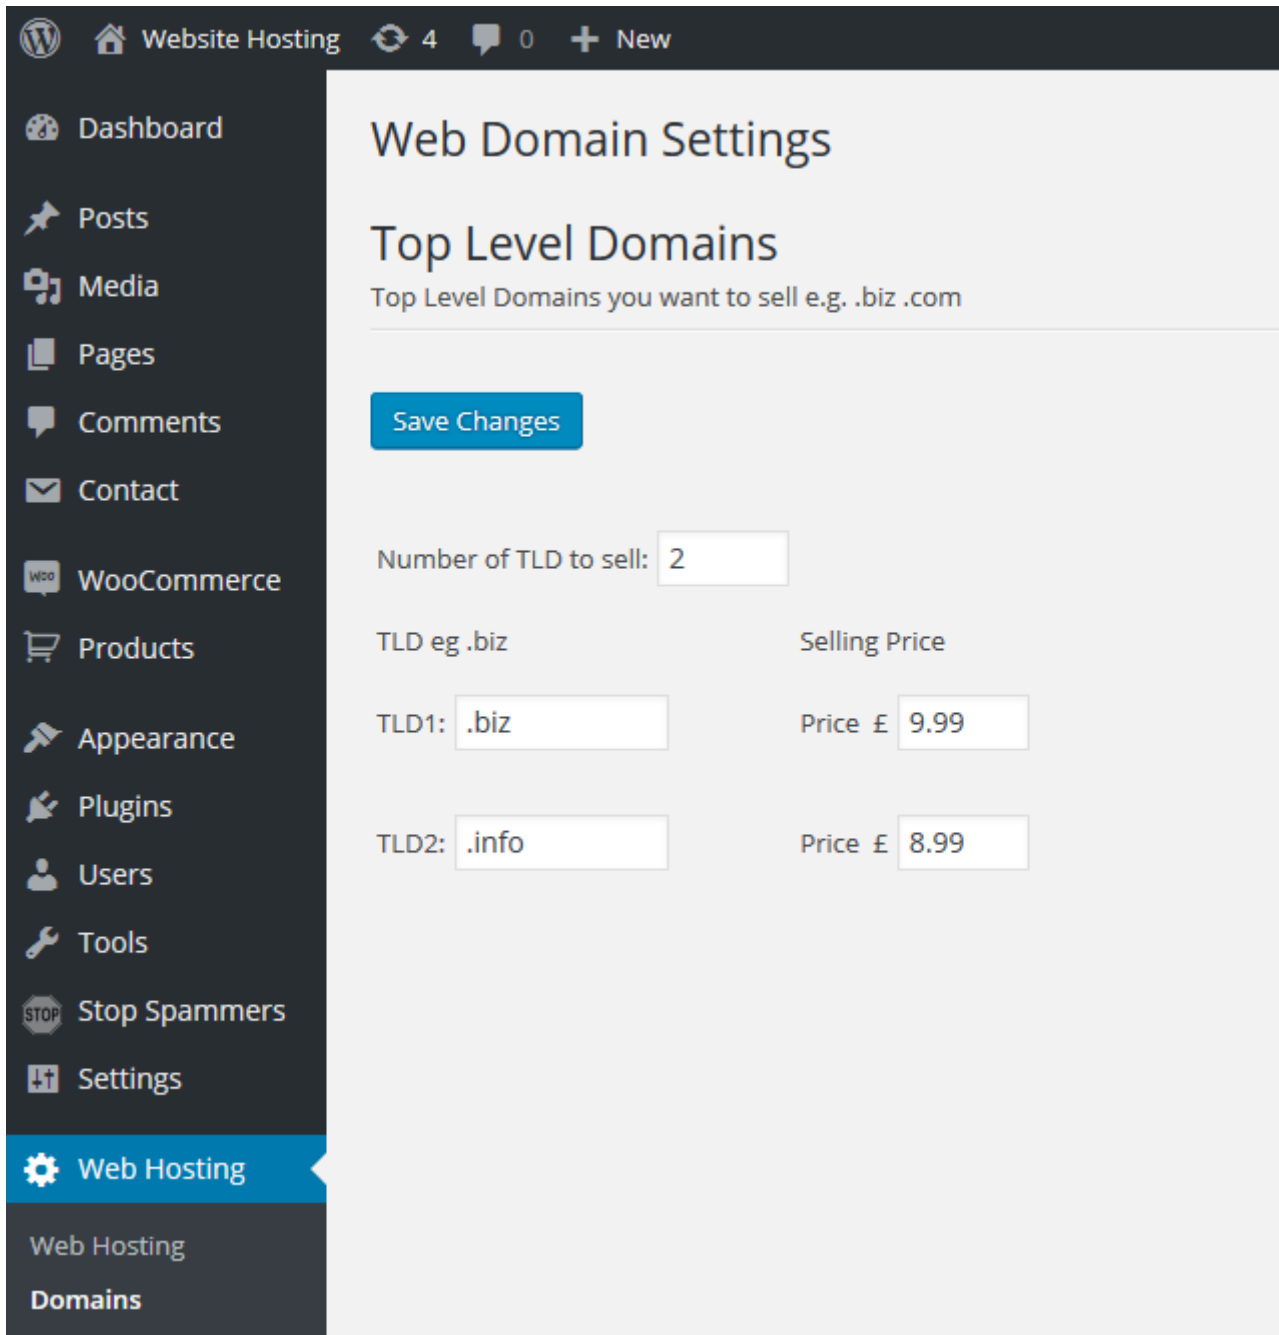

In left-hand admin menu go-to **Web Hosting → Orders**

Currently there is only one setting on this page number of days before a due invoice is sent out value in here is between 1 and 21

Domains

In left-hand admin menu go-to Web Hosting → Domains

enter in the first box (Number of TLD to sell:) the number of TLD's you wish to sell then click save this will create the required number of boxes needed. Enter the TLD's and your selling prices. Click Save Changes again.

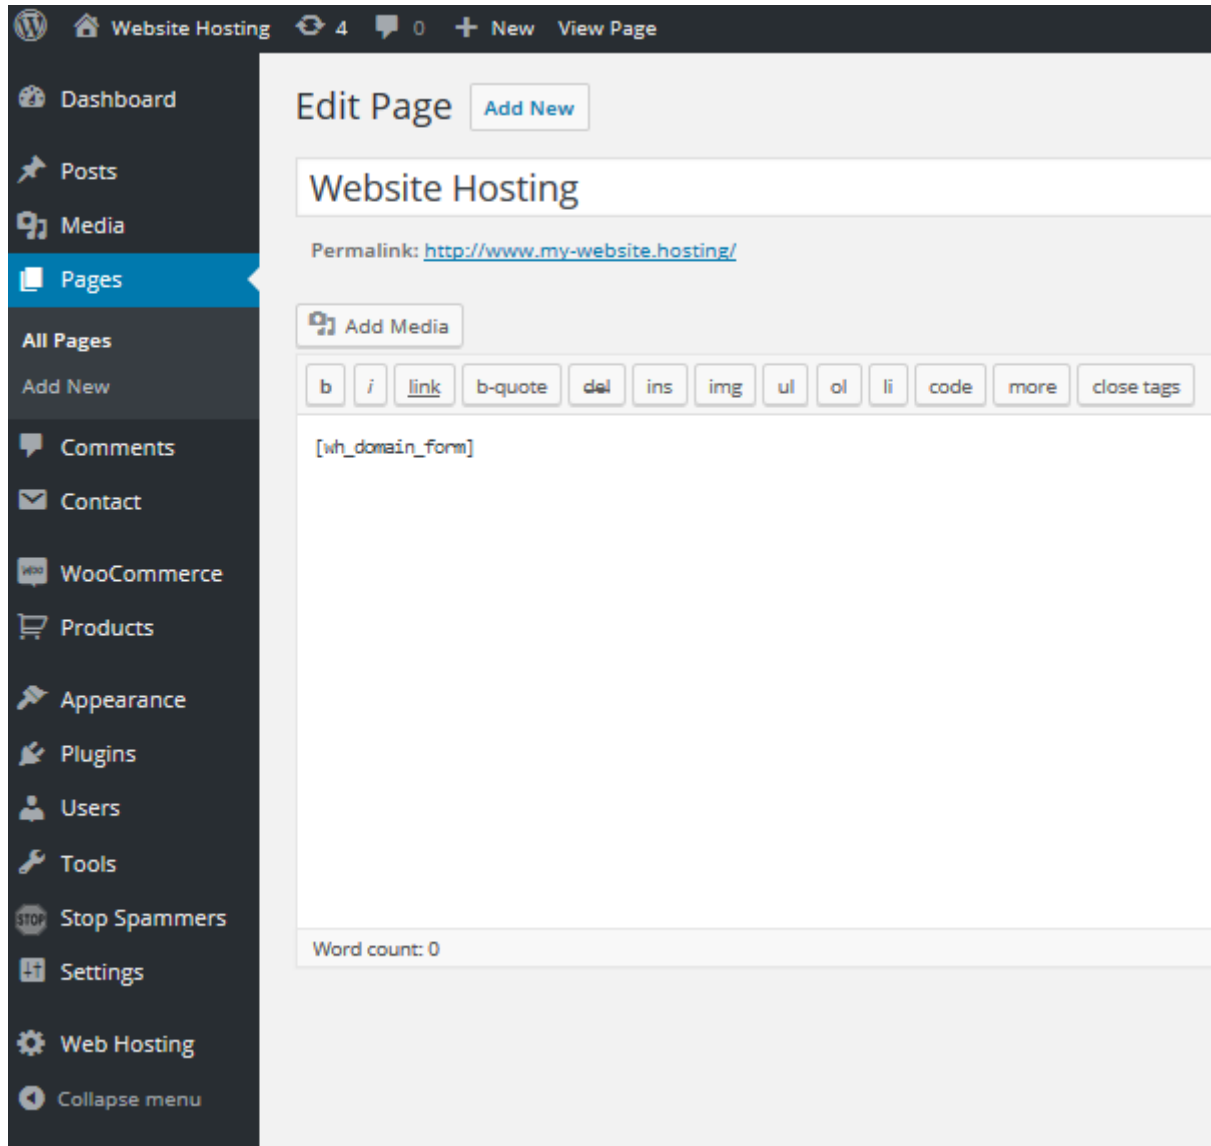

The screenshot shows the WordPress admin interface for 'Website Hosting'. The left-hand menu is visible, with 'Web Hosting' selected and 'Domains' highlighted. The main content area is titled 'Web Domain Settings' and 'Top Level Domains'. Below the title, there is a 'Save Changes' button and a text input field for 'Number of TLD to sell:' with the value '2'. Below this, there are two rows of input fields for TLDs and their selling prices. The first row shows 'TLD1: .biz' and 'Price £ 9.99'. The second row shows 'TLD2: .info' and 'Price £ 8.99'.

TLD eg .biz	Selling Price
TLD1: <input type="text" value=".biz"/>	Price £ <input type="text" value="9.99"/>
TLD2: <input type="text" value=".info"/>	Price £ <input type="text" value="8.99"/>

Shortcodes

Use shortcode `[wh_domain_form]` on any page post or in a widget to display search domain name form.

`[wh_transfer_domain_form]` used to create a transfer domain form on any page post or widget.

`[check_domain_name]` displays search domain name results

`[wh_wp_logout]` used to add logout link to any page post or widget.

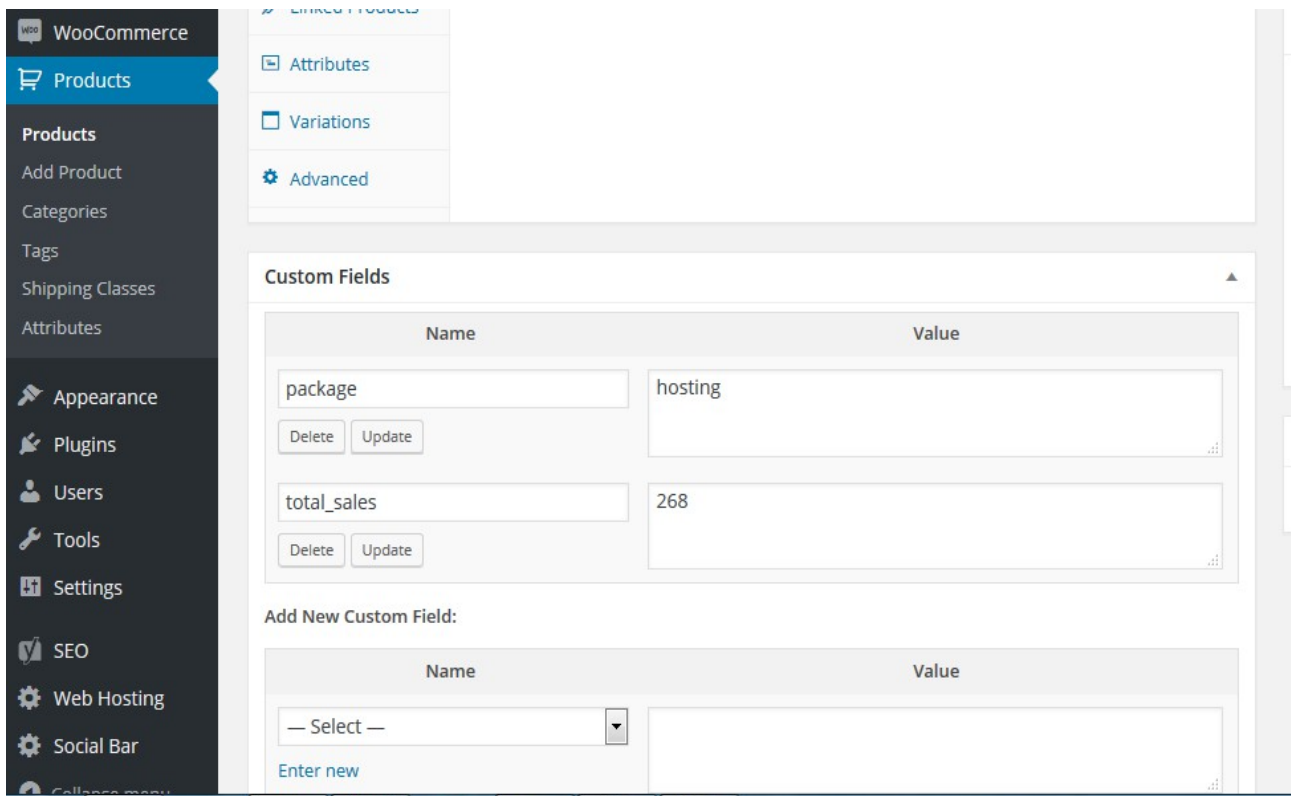

My Account

[wh_extra_fields] Use shortcode on My Account page to show customer account details this shortcode will display domain names, hosting packages, add-ons and allow customers to manage their domains.

If you are using WooCommerce 2.6.0 or above create a page called Control Panel and set the My Account page as the parent and place shortcode [wh_extra_fields] on this page.

Adding Hosting Packages

Just create your product as normal but you will need to add a custom field called package with a value called hosting. This is so the plugin can tell the difference between hosting products and domain products.
To view custom fields if its hidden click on Screen Options at the top of the page and check Custom Fields.

The screenshot shows the WordPress Custom Fields interface. On the left is a dark sidebar with the WooCommerce logo and a menu including Products, Appearance, Plugins, Users, Tools, Settings, SEO, Web Hosting, and Social Bar. The main content area is titled 'Custom Fields' and contains a table with two columns: 'Name' and 'Value'. There are two rows of existing custom fields:

Name	Value
package	hosting
total_sales	268

Each row has 'Delete' and 'Update' buttons. Below the table is the 'Add New Custom Field:' section, which includes a dropdown menu for 'Name' (currently showing '-- Select --') and an empty 'Value' field. A link 'Enter new' is visible below the dropdown.

Web Hosting plugin also supports variable product prices ensure you use Cost as the Name: and £0.00 **per month** and £0.00 **per year** in the value(s): just replace £0.00 with your own prices.

The screenshot shows the 'Product Data' meta box for a 'Variable product'. The left sidebar contains navigation tabs: General, Inventory, Shipping, Linked Products, Attributes (selected), Variations, and Advanced. The main content area is titled 'Cost' and includes a 'Name:' field with the value 'Cost' and a 'Value(s):' text area containing '£2.99 per month | £34.99 per year'. There are two checked checkboxes: 'Visible on the product page' and 'Used for variations'. At the top right of the main area is an 'Add' button and an 'Expand / Close' link. At the bottom left is a 'Save Attributes' button, and at the bottom right is another 'Expand / Close' link.

Variation Description:

#22: £2.99 per mor:

 SKU: [?](#)

When naming hosting products the name must match your package name on WHM for example

package name on WHM = webuk_basic-shared-hosting

your product name = basic-shared-hosting

Invoices

There is a couple of ways to automatically send due invoices.

1 add the shortcode [wh_subscriptions] to a secret page which you can load once a day this will activate the code to check customers orders and look for any orders in which payments are due if any are found a new order will be created. The customer will receive an order and invoice in PDF format. These new orders can be created between 1 and 21 days before they are due for payment this can be set within admin area.

2 add this code to your themes header `do_action('wh_subscription');` your website should get at least one page load per day but I recommend using option 3.

3 use plugin Advanced Cron Manager and add a new task using `wh_subscriptions` as a hook and set it to run once a day.

To change the default logo on order emails and invoices place your logo into the `www.yoursite.com/wp-content/plugins/web-hosting/images/` folder and name it `logo.png` image must be 100px X 100px in size.

Having problems then please email us at support@web-uk.co.uk
